Williams is one of North America's largest natural gas gatherers and processors, dedicated to becoming the most reliable midstream service provider in the industry. We are focused on running largescale assets and running them well.

The Bluestem Pipeline is a 189.2 mile-long, 16-inch diameter Natural Gas Liquid (NGL) pipeline in Kansas and Oklahoma. The Bluestem system is designed to initially transport 110,000 BPD with an ultimate planned design flow rate of 225,000 BPD of Y- Grade NGL. The primary source of the NGL flowing into Conway is from the existing Overland Pass Pipeline (OPPL) system. The OPPL currently transports NGL from southern Wyoming and Northern Colorado into salt cavern storage at the Mid-Continent Fractionation and Storage facility. Bluestem will receive NGL from storage at Conway and transport it south for delivery to Targa Resources at Kingfisher, OK.

Williams, through its subsidiaries, finds, produces, gathers, processes, and transports natural gas. Williams' operations are concentrated in the Pacific Northwest, Rocky Mountains, Gulf Coast and Eastern Seaboard. More information is available at http://www.williams.com.

COMMITMENT TO SAFETY, HEALTH & ENVIRONMENT

Williams is committed to safety and reliability. Overland Pass Pipeline is monitored 24 hours a day, seven days a week by highly skilled operations personnel using sophisticated, state-of the-art technology. Our company has a long-standing mission to be an exceptional neighbor in the communities where we have operations. Williams' employees volunteer, donate money, and serve on boards of nonprofit organizations. We pride ourselves on promoting responsible development, being responsible operators and working with landowners, government, and regulatory agencies.

EMERGENCY PREPAREDNESS

As partners in safety, we value the unique skills and expertise of our local emergency response organizations. Working together, the energy industry and emergency response agencies have built positive, collaborative relationships. Company representatives meet regularly with firefighters, emergency management officials, law enforcement officers, public officials, and planning agencies to review emergency response procedures.

Sumner

Changes may occur. Contact the operator to discuss their pipeline systems and areas of operation.

In case of an emergency, Williams will immediately dispatch personnel to the site to help handle the emergency and to provide information to emergency responders. We will also take the necessary operating actions – starting and stopping equipment, closing, and opening valves, and other steps – to minimize the impact of the emergency. Emergency Response Plans have been developed by Williams in conjunction with existing emergency plans developed by federal, state, and local authorities. These plans are presented annually to the local emergency planning organizations.

For more information on our Emergency Response Plans, please call:
