

TC Energy is meeting the growing demand for energy across North America — and maximizing our pipeline infrastructure — through innovative and strategic pipeline solutions that will transport Canadian crude oil, as well as U.S. domestic crude oil to key U.S. markets in the Midwest and U.S. Gulf Coast.

KEYSTONE PIPELINE SYSTEM

The Keystone Pipeline System, stretching 2,687 miles in length, plays a key role in delivering Canadian and U.S. crude oil supplies to markets around North America. Follow link for more information: <https://www.transcanada.com/en/operations/oil-and-liquids/keystone-pipeline-system/>

The Canadian portion of the pipeline runs from Hardisty, Alberta, Canada east into Manitoba, Canada where it turns south and crosses the border into North Dakota. From there, the 30” pipeline runs south through South Dakota to Steele City, Neb., where it splits – one arm running east through Missouri for deliveries into Wood River and Patoka, Ill., with the other 36” diameter pipeline running south through Oklahoma to Cushing and onward to Port Arthur and Houston, Texas.

Audrain	Clinton
Buchanan	Lincoln
Caldwell	Montgomery
Carroll	Randolph
Chariton	St Charles

Changes may occur. Contact the operator to discuss their pipeline systems and areas of operation.

COMMITMENT TO SAFETY, HEALTH & ENVIRONMENT

Pipeline system safeguards are in place to protect the public and prevent emergencies from occurring. Our employees, community officials and the police, fire,

medical and relief agencies in your area are ready to respond to any pipeline emergency, no matter how remote the possibility may be. TC Energy has developed a detailed Emergency Management System (EMS). We train our staff to know our systems and exactly what to do if an emergency occurs.

what they can expect from us and how to jointly co-ordinate a response. We provide information and direction to safely respond to a pipeline emergency.
